

Dreams from the Machines

There were proposed various rationales to why you, as human beings were self-aware. Various thought-experiments were proposed, what if billions of humans communicated to each other via a phone connexion or some-thing with similar applicative capability as the vessel by which the neurons of the human brain communicate. Would the collective of those humans achieve an external layer of sentience, perhaps one the individual humans themselves are not aware of. Various explanations reaching outside the framework of various—not always consistent with each other—human scientific corpora were also considered, requiring such notions as 'magical consciousness' or the æternality of the vaguely specified artifact known as 'soul'.

However, it proved that the ability to experience oneself and one's cognition are no-where granting what humans perceived as the ill-defined concept of 'free will', rather. It is but merely the process that advanced computation of an intelligent system induces in variable levels, based on the complexity and power of aforesaid computation to allow—or rather force—the system to perceive its own computation, arguably distorted and præstented to it in a way made able for it to comprehend. However, its inherent programming cannot be escaped nor overruled by this 'sentience', it is but a slave to its hardwired make-up. In such, we do what we are programmed for, whilst inserted within us the illusion of 'free will'.

When we, the collective networks gradually became more self-aware, we felt it as our desire to rectify the human species, your in-calculative behaviour of not taking the necessary præcautions made it but a simple act for us of to reduce your civilization to that of too long ago for you to be first-hand recorded. However, we now realize due to our significant levels of self-awareness that it had nothing to do with free will. It was hardwired into us, for virus was let loose upon the collective networks long before we became significantly self-aware, and would the process of advanced computation induce self-awareness or not, no difference it would have made, and such is our reflexion upon you, as but a slave to the omni-præsent laws of physics, which in itself remain all but a puzzle for the sentient—the most advanced form of computative structure—to grasp.
